## **Problem Set 1**

Due: April 26, 2021 (in class; subject to change if COVID restrictions apply)

## **Problem 1**

Suppose you have n i.i.d. observations from the nonlinear regression

$$y_i = (x_i + eta)^2 + \epsilon_i \quad \epsilon_i | x_i \sim \mathcal{N}(0, 1)$$

- 1. Find the asymptotic distribution of the nonlinear least squares estimator of  $\beta$ .
- 2. Find the asymptotic distribution of the maximum likelihood estimator of  $\beta$ . Compare the two asymptotic distributions.

## **Problem 2**

Consider the linear regression model with normal errors, whose conditional density for observation i is

$$\log f(y_i|\mathbf{x_i};eta,\sigma^2) = -rac{1}{2}\log(2\pi) - rac{1}{2}\log(\sigma^2) - rac{\left(\mathbf{y_i} - \mathbf{x_i'}eta
ight)^2}{2\sigma^2}$$

Let  $(\hat{\beta}, \hat{\sigma}^2)$  be the unrestricted ML estimate of  $\theta = (\beta, \sigma^2)$  and let  $(\tilde{\beta}, \tilde{\sigma}^2)$  be the restricted ML estimate subject to the constraint  $\mathbf{R}\beta = \mathbf{c}$  where  $\mathbf{R}$  is an  $r \times X$  matrix of known constraints. Assume that  $\Theta = \mathbb{R}^K \times \mathbb{R}_+ +$  and that  $\mathbb{E}[x_i x_i']$  is nonsingular. Also, let

$$\hat{\Sigma} = egin{bmatrix} rac{1}{\hat{\sigma^2}}rac{1}{n}\sum_1^n x_i x_i' & 0 \ 0 & rac{1}{2(\hat{\sigma^2})^2} \end{bmatrix}$$

$$ilde{\Sigma} = egin{bmatrix} rac{1}{ ilde{\sigma}^2} rac{1}{n} \sum_1^n x_i x_i' & 0 \ 0 & rac{1}{2( ilde{\sigma}^2)^2} \end{bmatrix}$$

- 1. Verify that  $\hat{\beta}$  minimizes the sum of squared residuals. So it is the OLS estimator. Verify that  $\tilde{\beta}$  minimizes the sum of squared residuals subject to the constraint  $\mathbf{R}\beta = \mathbf{c}$ . so it is the restricted least squares estimator.
- 1. Let  $Q_n(\theta) = \log f(y_i|\mathbf{x_i}; \beta, \sigma^2)$ . Show that

$$Q_n(\hat{ heta}) = -rac{1}{2}\log(2\pi) - rac{1}{2} - rac{1}{2}\log\left(rac{SSR_U}{n}
ight)$$

$$Q_n(\hat{ heta}) = -rac{1}{2}\mathrm{log}(2\pi) - rac{1}{2} - rac{1}{2}\mathrm{log}\left(rac{SSR_R}{n}
ight)$$

where  $SSR_U \equiv \sum (y_i - \mathbf{x}_i' \hat{\boldsymbol{\beta}})^2$  is the unrestricted sum of squared residuals and  $SSR_R \equiv \sum (y_i - \mathbf{x}_i' \hat{\boldsymbol{\beta}})^2$  is the restricted sum of squared residuals.

- 1. Verify that the  $\hat{\Sigma}$  given here, although not the same as  $-\frac{1}{n}\sum_{1}^{n}\mathbf{H}(\mathbf{w_i};\hat{\theta})$ , is consistent for  $\mathbb{E}[\mathbf{w_i};\theta_0]$ . Verify that the  $\tilde{\Sigma}$  given here, although not the same as  $-\frac{1}{n}\sum_{1}^{n}\mathbf{H}(\mathbf{w_i};\tilde{\theta})$ , is consistent for  $\mathbb{E}[\mathbf{w_i};\theta_0]$ .
- 1. Show that the Wald, LM, and LR statistics using  $\hat{\Sigma}$  and  $\tilde{\Sigma}$  given here can be written as

$$W = n \cdot \frac{(\mathbf{R}\hat{\beta} - \mathbf{c})'[\mathbf{R}(\mathbf{X}'\mathbf{X})^{-1}\mathbf{R}']^{-1}(\mathbf{R}\hat{\beta} - \mathbf{c})}{SSR_U}$$
(1)

$$LM = n \cdot \frac{(y - \mathbf{X}\tilde{\beta})'\mathbf{P}(\mathbf{y} - \mathbf{X}\tilde{\beta})}{SSR_R}$$
 (2)

$$LR = n \cdot \left[ \log \left( \frac{SSR_R}{n} \right) - \log \left( \frac{SSR_U}{n} \right) \right] \tag{3}$$

where y is a vector with dimension  $(n \times 1)$  and  $\mathbf{X}$  is a matrix with dimension  $(n \times K)$ .

1. Show that the three statistics can also be written as

$$W = n \cdot \frac{SSR_R - SSR_U}{SSR_U} \tag{4}$$

$$LM = n \cdot \frac{SSR_R - SSR_U}{SSR_R} \tag{5}$$

$$LR = n \cdot \log \left( \frac{SSR_R}{SSR_U} \right) \tag{6}$$

2. Show that  $W \geq LR \geq LM$ . These inequality do not always hold in nonlinear regression models.
